**Instructions**

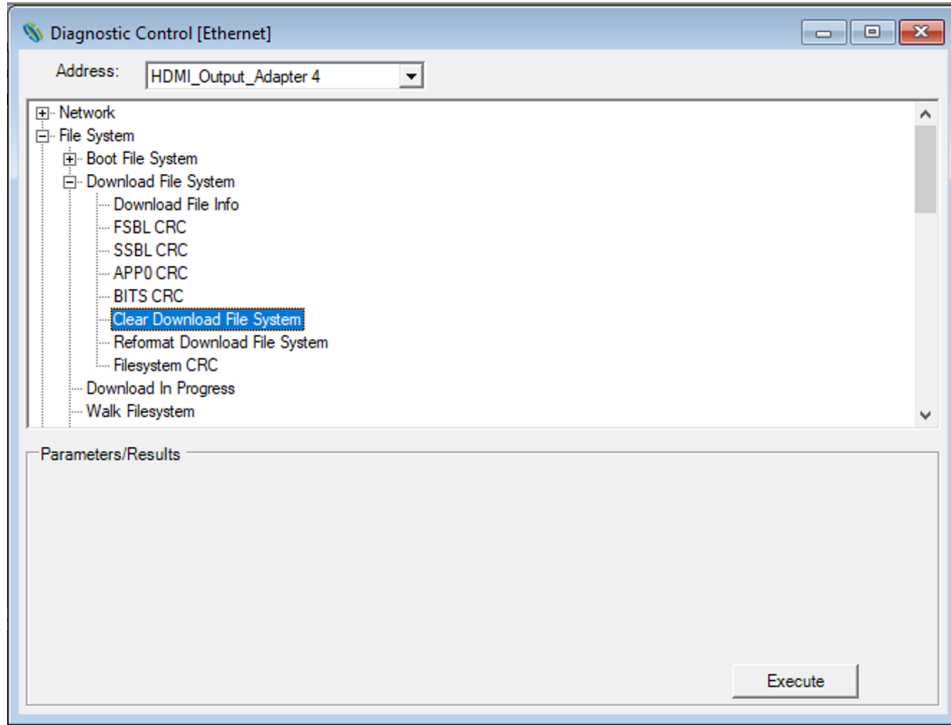

The file system structure is changed when updating 4K Devices – HDMI to SDI Adapters, 4K Monitors, SCBs, etc – from Rev A to Rev B. This will occasionally cause the device to show no information in the DNDL fields as shown below. If this happens, follow the instructions in this guide.

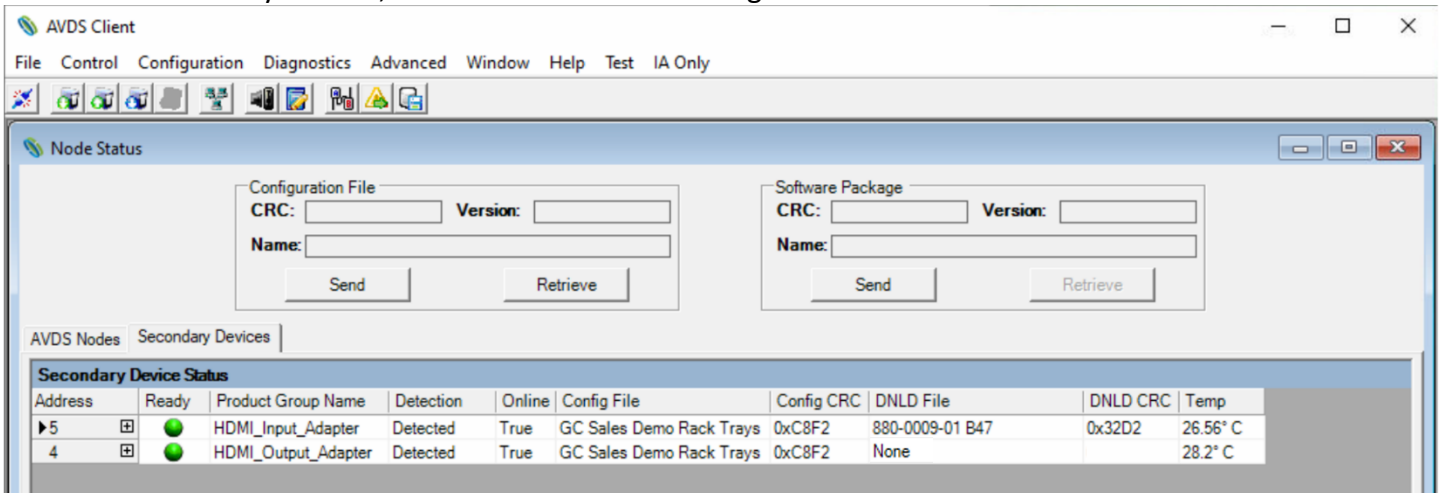

1) In AVDS Client, navigate to Advanced -> Diagnostic Control.

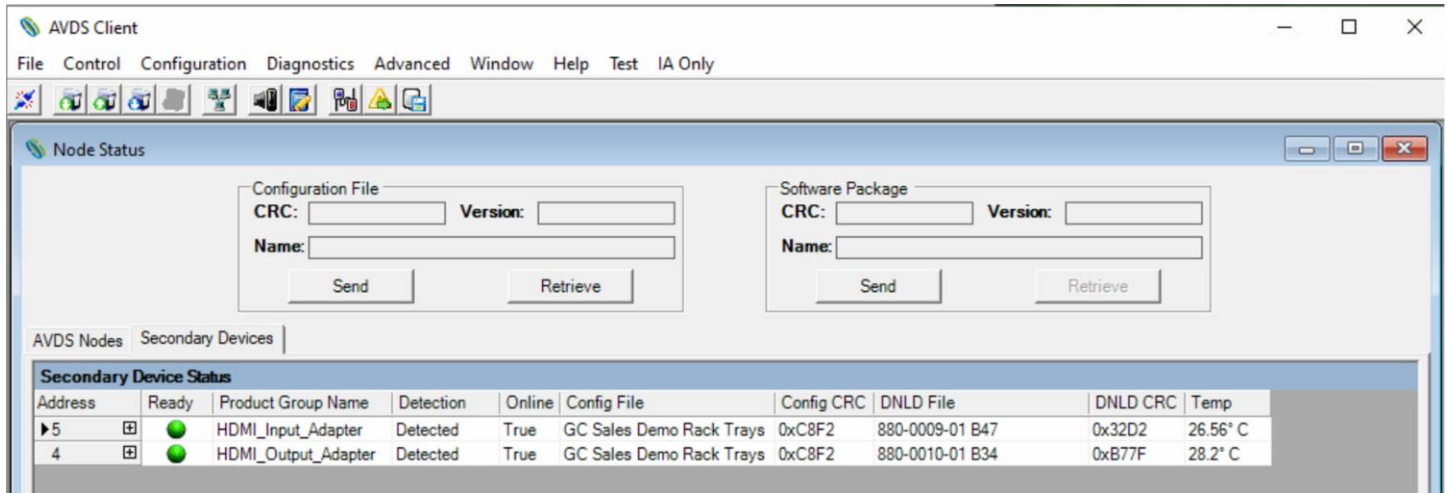

- Under Address, select the address of the device missing the DNDL data. Expand the menu to File System – Download File System – Clear Download File System. Click Execute. Repeat this step for each of the 4K Devices that are missing the DNDL information.

If successfully cleared, the DNDL field should change from blank to “None”.

- 3) Re-send the Rev B software to each of the device types. If successful, the DNDL field will now be populated with the correct information. You may also need to re-send the aircraft configuration file.
